

# From Problem Statement to a Self-Configuring, Zero-Leak Screening Tool

Method & reference architecture · how one tool serves any department without ever holding its data

## 1 Frame the problem

name the decision + its hidden framework

## 2 Separate data from logic

what is Tool vs what is Confidential Data

## 3 Build the tool

fixed engine + UI + config loader + report builder

## 4 Configure

department fills the config workbook — not the tool

## 5 Run a session

upload · analyse · export, all in the browser

## 6 Reset

refresh wipes framework + resumes

TRUST BOUNDARY

### THE TOOL · this single HTML file

Ships with ZERO framework. Identical for every customer. Shareable and demoable.

#### Fixed engine [ENGINE]

- PDF text extraction + on-device OCR
  - Date / experience reconciliation
  - Generic keyword scoring (PCI)
  - Best-fit level + screening flags
- No company data. Same for all.

#### User interface [UI]

- 3-step wizard: load → add → review
- Enterprise dashboard + tables
- Experience audit (reviewer edits)
- In-memory only; reset button

#### Config loader [CONFIG]

Reads the uploaded workbook and builds the in-memory framework: levels · skills · scoring · questions. The ONLY bridge between the tool and your data. Strict, with clear validation errors.

#### Report builder [CONFIG]

Generates the evaluation kit LIVE from the loaded framework. No confidential template is baked into the tool — the kit format comes from your workbook.

### CONFIDENTIAL DATA · stays yours

Never written into the tool. Lives only in browser memory during a session.

#### Configuration workbook (.xlsx template you fill)

Setup · Levels · Technical Skills · Behavioral · Competencies · Questions  
Mirrors the Master-Skills format. Yellow sample cells → replace with your framework.  
You keep this file. Upload it to run; it is never stored by the tool.

#### Resumes (PDF)

Uploaded per session, parsed in the browser (text layer or OCR). Held in memory as extracted text only. Never uploaded anywhere. Erased with everything else on refresh / close / Reset.

Open the tool

Upload config  
(in memory)

Upload resumes  
(in memory)

Analyse  
(fixed engine)

Review dashboard

Export kit  
(built from config)

Refresh ⇒ ERASE  
framework + resumes

### Data-sensitivity boundary

The dashed boundary is the trust line. Left of it = code that carries no data and can be shared freely.

Right of it = your framework and the resumes, which exist only in this browser tab and are wiped on refresh.

There is no server, no upload, no database, no localStorage for any confidential data — separation is structural, not a policy.
